

A console error was showing when I clicked a link to any of the pages that didn't have the element 'password'. It also stopped the rest of the JS as the nav bar would not operate in mobile.

```
// Live validating the password

var password = document.getElementById('password')
password.onkeyup = function(){
var passw = /^(?=.*\d)(?=.*[a-z])(?=.*[A-Z]).{8,20}$/;
var input = document.getElementById('password')
if(input.value.match(passw))
{
$("#validatedPassword").removeClass('hidden');
}
```

Fix code

I wrapped the JS in a function that requires the user to click on the password element before it starts to look for characters. This stopped the console error.

```
// Live validating the password
$("#password").click(function(){
var password = document.getElementById('password')
password.onkeyup = function(){
var passw = /^(?=.*\d)(?=.*[a-z])(?=.*[A-Z]).{8,20}$/;
var input = document.getElementById('password')
if(input.value.match(passw))
{
$("#validatedPassword").removeClass('hidden');
}
```
